SOLAR SOUND 2

Instructions for connecting Bluetooth
on a Windows Vista PC or Laptop

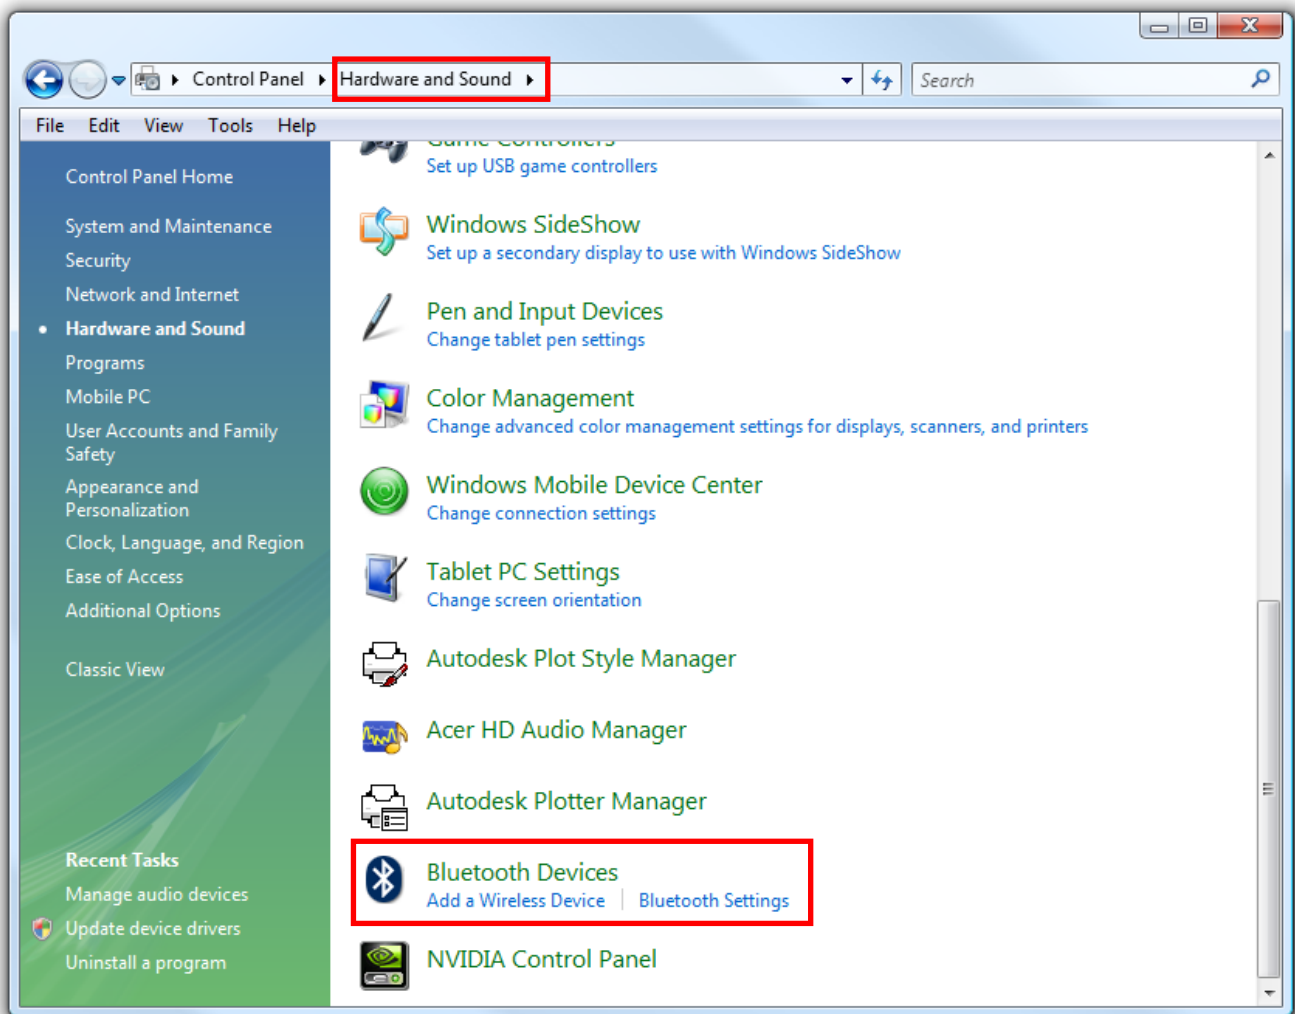

Note, the following instructions should work on most Windows XP, Windows Vista and Windows 7 computers, although the process may vary slightly. The overall process of pairing, connecting audio and setting the audio output are applicable to most computer systems such as Linux and Apple OS-X.

1) Turn on the Solar Sound 2 and any physical Bluetooth switches on your laptop or PC or connect your Bluetooth dongle.

Next, open Windows control panel and select the “Hardware and Sound” section.

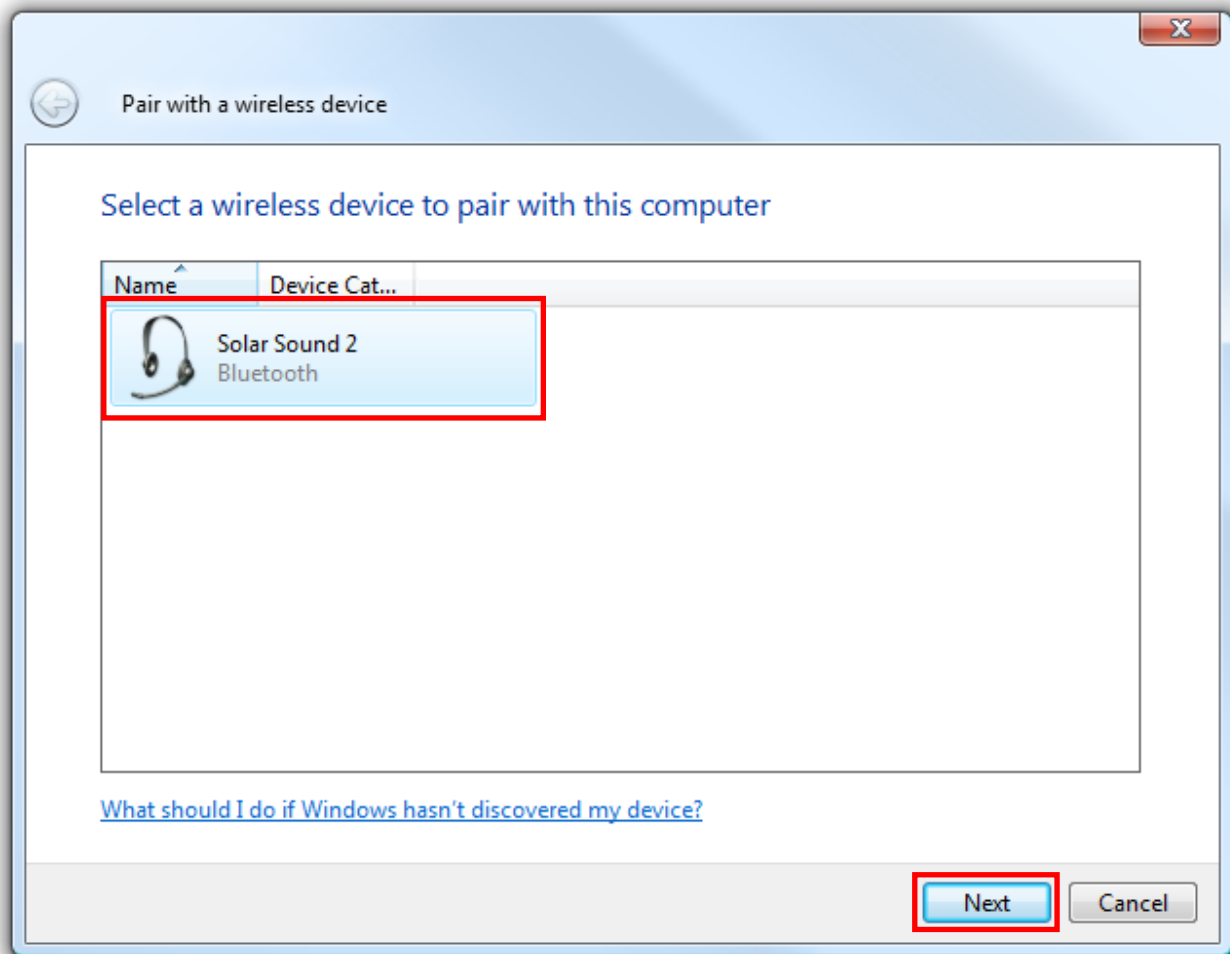

2) Scroll down and click on “Bluetooth Devices”

3) Select “Add Wireless Device”, which will start the device searching and pairing process.

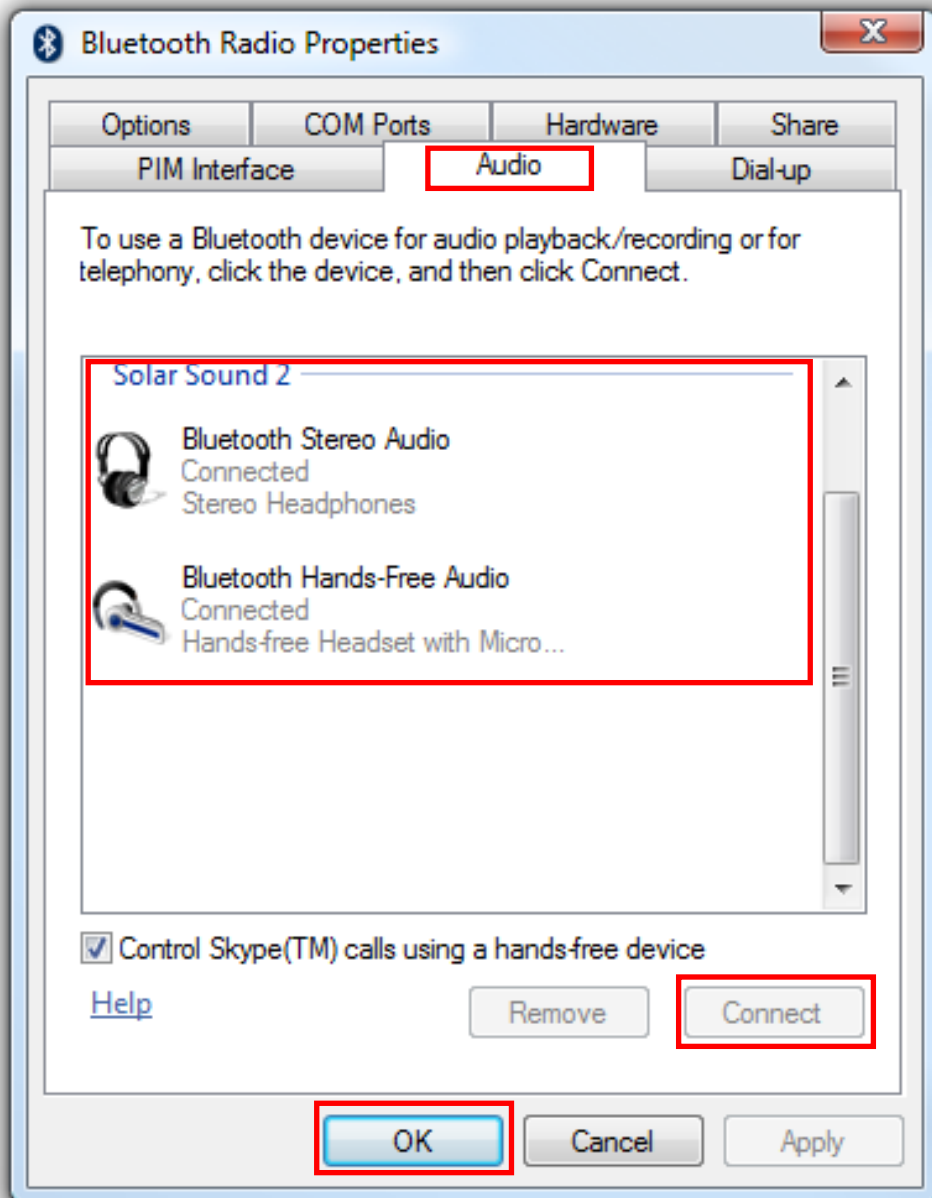

4) Select the Solar Sound 2 then click “next” to proceed pairing with the Solar Sound 2. It may take up to 30 seconds to connect.

5) Your computer is now paired to the Solar Sound 2, but you still have to connect the audio. To do this, click on “Bluetooth Settings”.

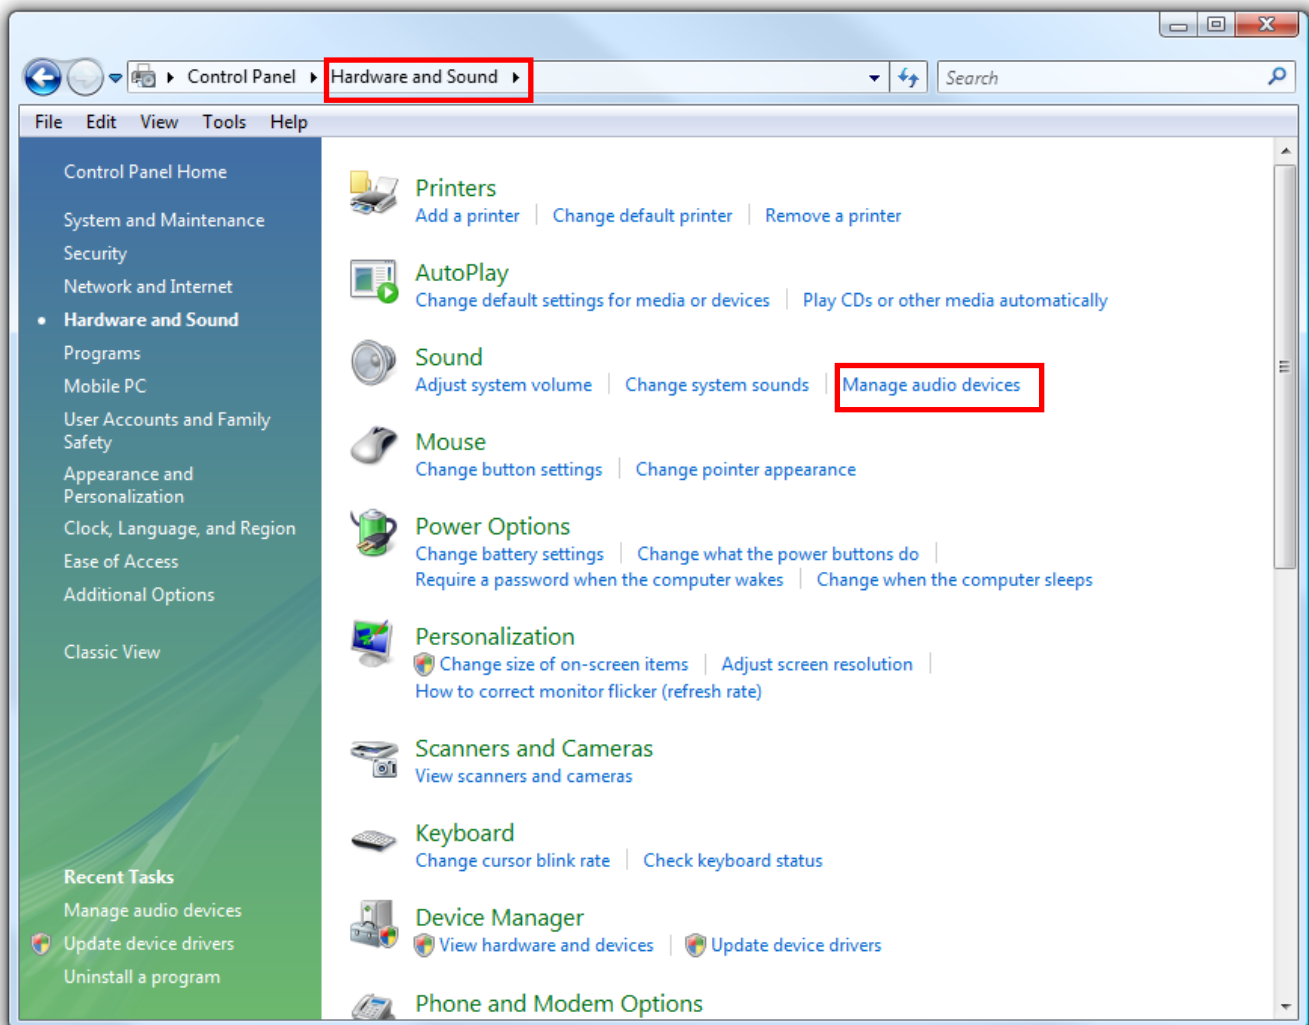

6) Click the “Audio” tab and check that “Bluetooth Stereo Audio” and “Bluetooth Hands-Free Audio” are both connected. If not, click them and press “connect”. When done, click “Ok” to exit.

7) Your computer is now fully connected to the Solar Sound 2 and you can exit the Bluetooth control window.

However, you must still select the Solar Sound 2 as an audio output in the windows settings. To do this, open the “Hardware and Sound” section of Windows control panel again, and click on “Manage Audio Devices”.

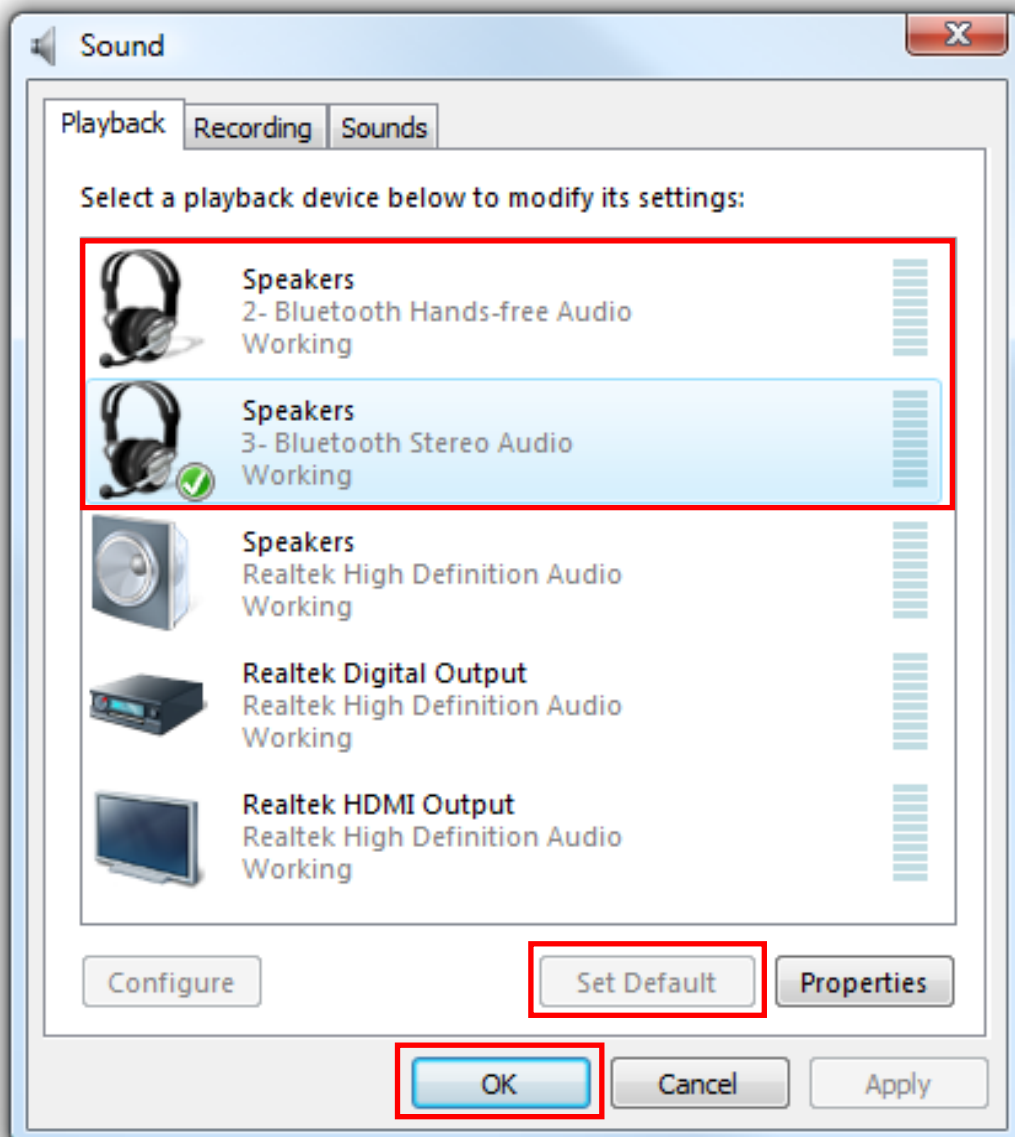

8) For stereo music or sound streaming, select the “Bluetooth Stereo Audio” option and click “Set Default”.

For Hands-free Audio using the microphone, select the “Bluetooth Hands-free Audio and then “Set Default”.

Click Ok.

Finally, before you can start using the Solar Sound 2 as an audio output you must restart (exit the software then open the software again) any software you intend to use, such as iTunes, Skype etc.

Thank you for using Devotec Industries products.
